Documentation

Journal Review - Peer and Self

During this activity, I did not attend the class session. However, I was still able to engage with the process by reviewing feedback and journal entries shared through the class materials and working through the Journal Checklist independently. This allowed me to evaluate both my own work and understand expectations for clarity, completeness, balance of visuals and text, and technical implementation.

After reviewing my own journal entries, I identified three key moments that significantly shaped my project direction. The first key moment was when I refined my app concept to focus more specifically on addressing loneliness and improving user wellbeing. This helped me clarify the purpose of my project and define a more focused target audience. The second key moment was receiving peer feedback during the Padlet critique, which highlighted issues with navigation and onboarding. This feedback was important because it showed me that usability is just as important as concept strength. The third key moment was when I began improving the visual design in Figma by adjusting spacing, typography, and layout hierarchy, which improved readability and overall design quality.

Practice Consultations Reflection

During the practice consultation, I did not participate in the in-class activity. However, reflecting on the question prompts, I recognise that my responses would need to be more structured and detailed when explaining my design decisions. While I can clearly communicate the purpose of my project, I need to improve how I connect my work to broader ideas about data, user experience, and design thinking. In future consultations, I will focus on giving more confident, structured answers supported by specific examples from my design process.

Showcase Planning

For the showcase planning task, I was not present in class, but I reviewed the instructions and understood the requirements. I added my project to the class Miro board and selected a preferred location for installing my work based on the shared layout. This helped me understand how my project fits within the overall exhibition space. I will ensure I am prepared for installation at 2 pm on Friday 05 June.

Journal Finalisation Summary

My journal has been completed and refined to document the full development of my project. It includes entries across the required weeks, showing my design process from initial ideas through to final development. Each entry includes reflection rather than just description, explaining what I learned, what feedback I received, and how I responded to it.

Key evidence such as Padlet feedback, peer critique comments, and design iterations in Figma has been included to support my development process. The journal shows how my project evolved over time, particularly in response to feedback around usability, navigation, and onboarding.

Overall, the journal presents a clear narrative of my design journey. It demonstrates how I refined my concept of a loneliness-focused app through testing, feedback, and visual design improvements. I have ensured the formatting is consistent and that each entry clearly links reflection to action.

Final Project Summary

My project is a digital mobile application designed to help address loneliness and improve user wellbeing through connection and supportive interaction. The target users are individuals who may feel socially isolated or disconnected and are looking for simple, accessible ways to engage with others or feel supported.

The main purpose of the app is to provide a safe and easy-to-use platform that encourages positive connection and reduces feelings of loneliness. The design focuses on simplicity, clarity, and emotional accessibility to ensure users can navigate the app without confusion or barriers.

I developed this project using Figma, iterating through multiple design stages based on peer feedback and self-evaluation. Early feedback highlighted issues with navigation and onboarding, which led me to simplify the user flow and improve clarity for first-time users. I also refined the visual design by adjusting typography, spacing, and layout hierarchy to improve readability and user experience.

The final outcome is a more refined and user-friendly interface that clearly communicates its purpose. The project demonstrates my ability to respond to feedback, improve usability, and develop a concept into a functional digital design solution focused on wellbeing.

Studio Consultation Preparation

My project is a loneliness-focused mobile app designed to support user wellbeing through simple and accessible digital interaction.

Key points to explain:

- Target audience: people experiencing loneliness or social disconnection
- Problem: lack of simple, supportive digital spaces for connection
- Solution: a user-friendly app with clear onboarding and simple navigation
- Tools used: Figma for design and prototyping Improvements made: simplified navigation, improved onboarding, better typography and spacing

Feedback I can reference:

- Navigation was too complex → simplified user flow
- Onboarding was unclear → improved first-time user guidance
- Layout needed better spacing and readability

Reflection

I learned that usability is just as important as concept. Feedback helped me improve clarity and structure in my design, especially for new users.
